

Brodal plus Eclipse

Diflufenican + metosulam.

Rates quoted in HerbiGuide are for a 10:1 mixture of Brodal with Eclipse. 55 mL of the mixture is equivalent to 50 mL of Brodal plus 5 grams of Eclipse.

See the individual components for further information.

This mix has generally provided better control of Wild Radish than either product alone. The Brodal component is more active on the young weeds and those germinating after spraying and the Eclipse provides good control of the larger weeds. It has often been safer on the crop than higher rates of the individual products.

See individual products for more label and MSDS information.
